

IN THE CLAIMS:

Please amend the claims as follows:

1. (previously presented) A joining device for attaching a body, comprising:
a first body having a first wall with an inner side and extending substantially at a right angle to a second wall of a second body, said first body being inserted into said second body;
a plurality of detent bosses connected to said inner side of said first wall, said plurality of detent bosses each being pressed by force into a respective one of detent openings formed in the second body, and said plurality of detent bosses being encircled by the second body in a pressed-in state; and
a plurality of connection devices each disposed in said first body for exerting the force on a respective one of said detent bosses.
2. (previously presented) The joining device according to claim 1, wherein said first body has a plurality of springs connected to said first wall and said plurality of detent bosses are each disposed on a respective one of said plurality of springs.
3. (previously presented) The joining device according to claim 2, wherein said plurality of springs are disposed at an acute angle to the second wall.
4. (previously presented) The joining device according to claim 2, wherein said plurality of springs are connected monobloc to said first wall.
5. (previously presented) The joining device according to claim 1, wherein the detent openings are sack hole bores and said detent bosses are configured for engaging the sack hole bores.
6. (previously presented) The joining device according to claim 1, wherein said connection devices are selected from the group consisting of screws, pins and bolts.

7. (previously presented) The joining device according to claim 2, wherein said first body has a plurality of support walls on an inside of said first wall, and substantially vertical to said first wall, and said plurality of connection devices which are disposed between said plurality of support walls and said plurality of springs can be screwed or inserted into said first body.

8. (currently amended) A joining device for attaching to a first body, which is inserted into a second body, the first body having a first wall extending substantially at a right angle to a second wall of the second body, the joining device comprising:

a plurality of detent bosses connected to an inner side of the first wall and said plurality of detent bosses each being pressed by force into a respective one of detent openings formed in the second body, said plurality of detent bosses being encircled by the second body in a pressed-in state; and

a plurality of connection devices each disposed in the first body for exerting the force on a respective one of said detent bosses, each of the plurality of connection devices maintaining the corresponding detent boss in the pressed-in-state in the corresponding opening to engage the first body to the second body.

9. (previously presented) The joining device according to claim 8, further comprising a plurality of springs connected to the first wall and said plurality of detent bosses each being disposed on a respective one of said plurality of springs.

10. (previously presented) The joining device according to claim 9, wherein said plurality of springs are disposed at an acute angle to the second wall.

11. (previously presented) The joining device according to claim 9, wherein said plurality of springs are connected monobloc to the first wall.

12. (previously presented) The joining device according to claim 8, wherein the detent openings are sack hole bores and said detent bosses are configured for engaging the sack hole bores.

13. (previously presented) The joining device according to claim 8, wherein said connection devices are selected from the group consisting of screws, pins and bolts.

14. (previously presented) The joining device according to claim 9, wherein the first body has a plurality of support walls on an inside of the first wall, and disposed substantially vertical to the first wall, and said plurality of connection devices which are disposed between the plurality of support walls and said plurality of springs can be screwed or inserted into the first body.

15. (previously presented) A kitchen appliance, comprising:

a first body having a first wall with an inner side and being a first housing part of the kitchen appliance;

a second body having a second wall with a plurality of detent openings formed therein and being a second housing part of the kitchen appliance, said first body being inserted into said second body, said first wall extending substantially at a right angle to said second wall of said second body; and

a joining device containing:

a plurality of detent bosses connected to said inner side of said first wall, said plurality of detent bosses each being pressed by force into a respective one of said detent openings of said second body, and said plurality of detent bosses being encircled by said second body in a pressed-in state; and

a plurality of connection devices each disposed in said first body for exerting the force on a respective one of said detent bosses.

16. (original) The kitchen appliance according to claim 15, wherein said first body is a floor part, said first wall is a floor plate, said second body is a sheathing part and said second wall is a sheathing wall.
